### Flame retardant air filter for PSA Peugeot Citroën

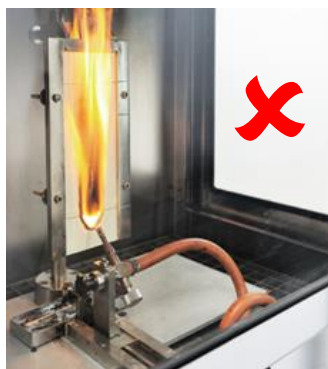

One requirement for engine air filters specified by vehicle manufacturer PSA is to supply air filter elements with flame-retardant properties. MANN+HUMMEL meets this requirement, impregnating not only its serial products but also MANN-FILTER air filter elements with halogen-free, flame retardant compounds.

OE-quality air filters from MANN-FILTER therefore provide added safety. Should the filter medium catch fire, through for example a glowing cigarette end entering the air intake, this will automatically go out within a few seconds, thanks to the impregnation.

Both, vehicle and passengers are thus effectively protected against risk of fire in the air filter system and its associated effects.

All new MANN-FILTER air filters with this property are marked as follows:

„Flame Retardant Media“.

Not flame retardant

Flame retardant according to DIN 53 438
